

EE161: Digital Communication Systems

Introduction

Robert Morelos-Zaragoza
Electrical Engineering Department
San José State University

Wireless Communication

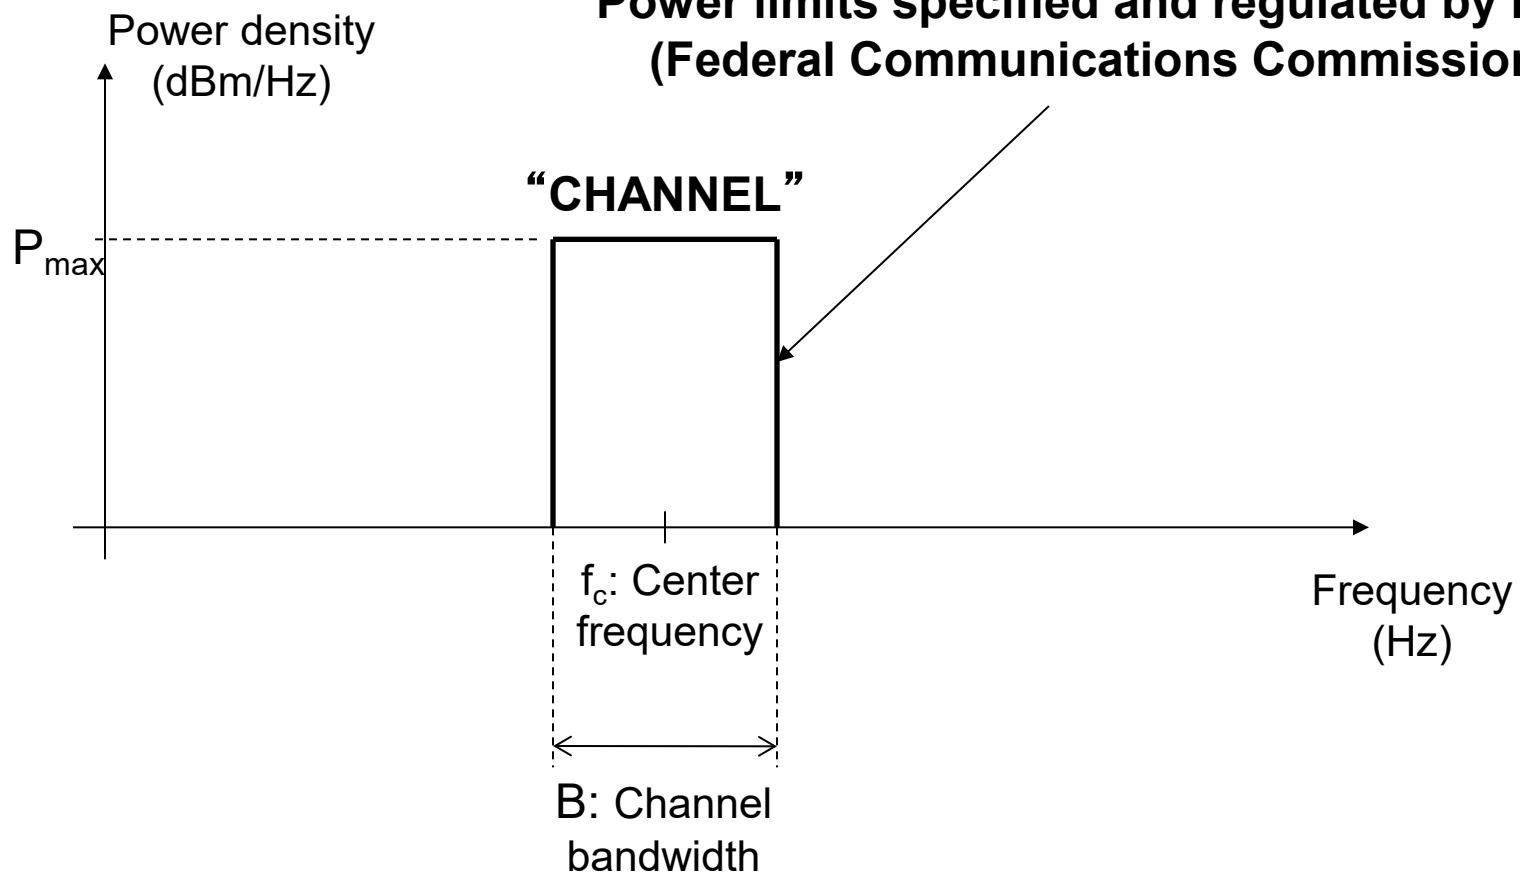

- Amplifiers are needed to reverse attenuation effects
- The “Air” is a national resource.
- Its use is regulated by the government ...

Spectral Occupancy

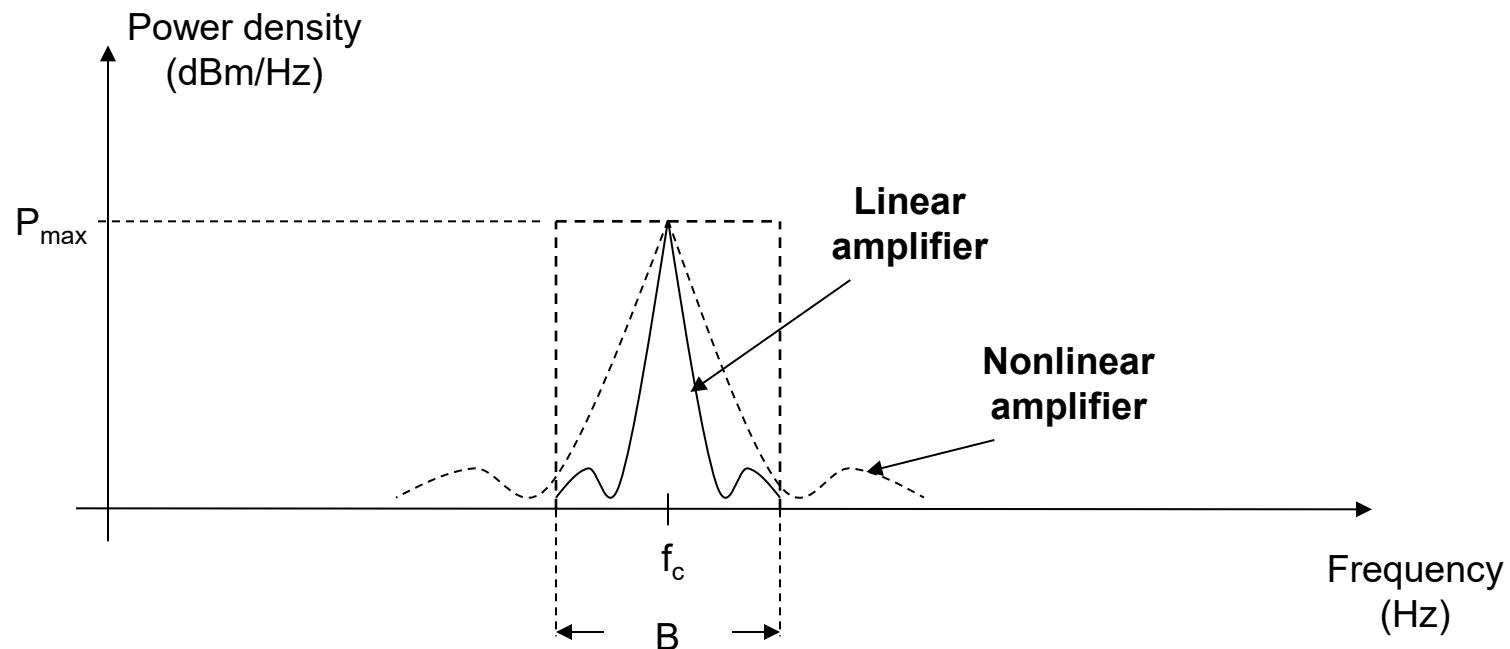

Spectral mask

**Power limits specified and regulated by FCC
(Federal Communications Commission)**

Nonlinearities

- Nonlinearities of RF (radio-frequency) *amplifiers* may cause additional spectral components (related to harmonics) that fall outside of the allocated channel bandwidth:

Example (EE160): Two-tone test

- Non-linear amplifier modeled via the input-output relation

$$V_o = a_1 V_i + a_3 V_i^3$$

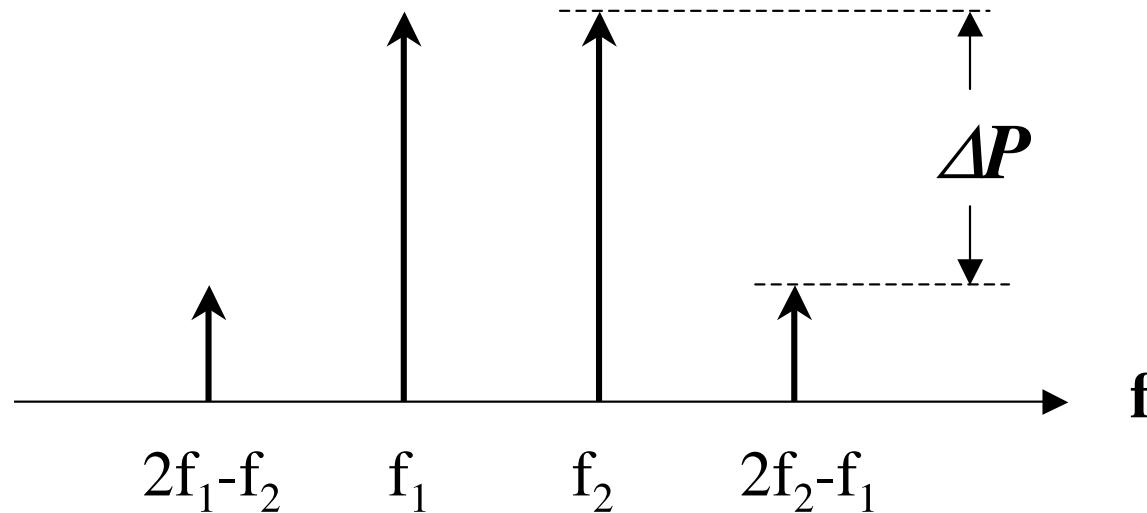

- Input:

$$V_i = A \left[\cos(2\pi f_1 t) + \cos(2\pi f_2 t) \right]$$

- Output:

$$\begin{aligned} V_o &= A \left(a_1 + \frac{9a_3 A^2}{4} \right) \left[\cos(2\pi f_1 t) + \cos(2\pi f_2 t) \right] \\ &\quad + \frac{3a_3 A^3}{4} \left[\cos(2\pi(2f_1 - f_2)t) + \cos(2\pi(2f_2 - f_1)t) \right] \end{aligned}$$

Spectral Regrowth

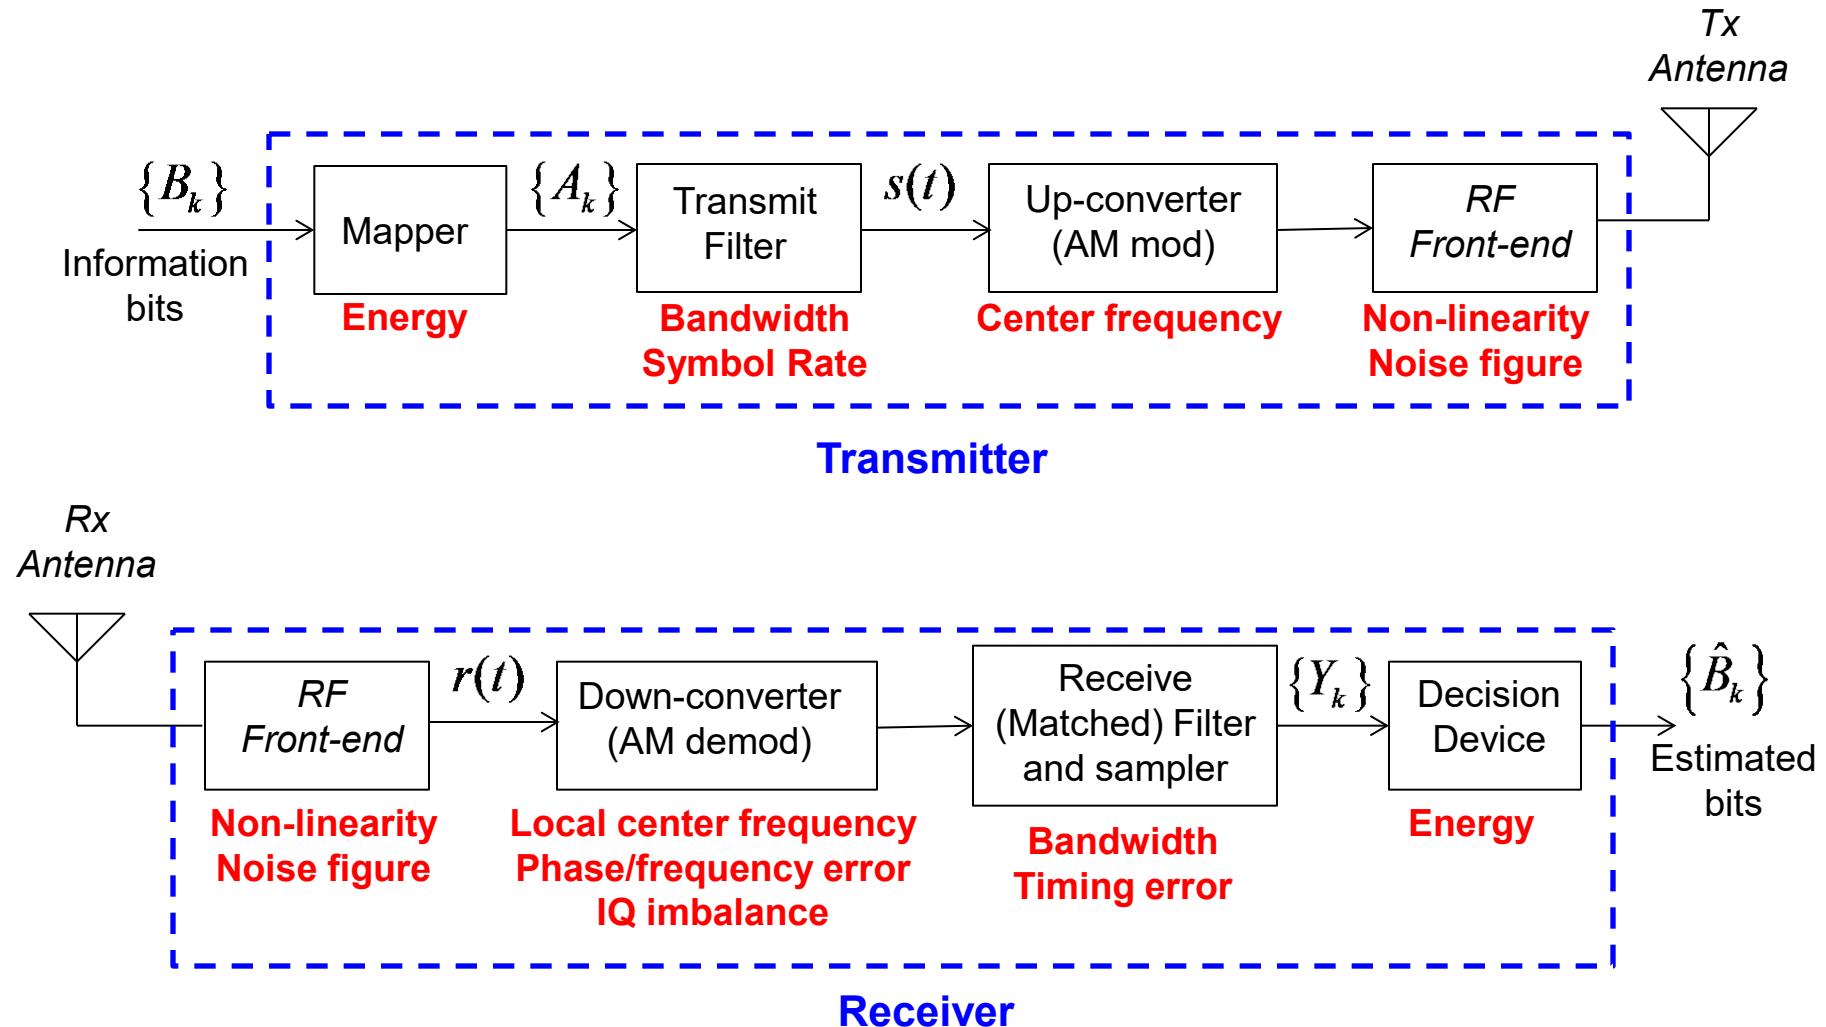

Measure of non-linearity (Third-order intercept point):

$$\text{IIP3 (dBm)} \approx \frac{\Delta P (\text{dB})}{2} + 20 \log_{10} A (\text{dBm})$$

A Wireless Communication System

Elements – I

- **Information bits:** Assumed to be *uniformly distributed*
 - Scrambler using a pseudo-noise (PN) sequence
 - Bit rate: $R_b=1/T_b$
- **Mapper:** BPSK ($L=1$ bit/symbol), QPSK (2 bits/symbol), 16-QAM (4 bits/symbol), etc ..
 - Symbol rate: $R_s=R_b/L$
 - Symbol duration: $T=L T_b$
- **Transmit/receiver filters:** Designed to limit bandwidth and *remove intersymbol interference (ISI)*
 - Square-Root Raised-Cosine (SRRC) filter

Elements – II

- **Up-converter**
 - Amplitude (quadrature) modulator
- **RF Front-ends (Tx and Rx)**
 - Mixers, Amplifiers and Filters
- **Down-converter**
 - Amplitude (quadrature) demodulator
 - Propagation delay, phase error and frequency error
 - Multipath
- **Sampling (EE252)**
 - Symbol rate at receiver is different from transmitter!
 - This causes symbol *timing errors*
 - Need to *oversample* and select or interpolate

Outline of EE161 course

1. Pulse shaping and mapping of bits to amplitudes
2. Binary modulations: BPSK, BFSK
3. Nonbinary modulations: M-PAM, M-PSK, M-QAM
4. Bandlimited channels: ISI and raised-cosine spectrum
5. Error control coding (ECC) via signal space
6. Modeling of wireless channels, multipath and fading
7. Modulations that are robust under wireless multipath fading conditions
8. Signal diversity techniques for wireless channels
 - ✓ Time: Interleaving/ECC, spread-spectrum
 - ✓ Frequency: OFDM with interleaving/ECC
 - ✓ Space: Receive/transmit diversity and MIMO

Canvas, textbook, MATLAB and Lab Demos!

- The material of this course is located in Canvas and contains class lectures, homework and exams as well as numerous MATLAB scripts and models
- The textbook is the same as that of EE160:
J.G. Proakis and M. Salehi, Fundamentals of Communication Systems, 2nd ed., Prentice Hall, 2014.
- There is a depository with all class material located at:
github.com/rmorelos/communications
- This course uses MATLAB to study the functionality and performance of wireless communication systems in homework and (take-home) exams
- **NEW: Experimental hands-on demonstrations using software radios (ADALM-PLUTO) in the RF Communications Laboratory**

Grading policy

- *Homework* is due one-week after posting
 - Solutions (PDF file) posted in the webpage
 - Based on **MATLAB** as much as possible
- Two *midterm exams*
 - First midterm is written, **in-person**
 - Second midterm is **take-home** (May need MATLAB or other graph-producing software)
- One *final project*: Oral presentation and written report

Item	Percentage
Homework	15%
Midterm 1	20%
Midterm 2	30%
Final presentation/report	35%

Next: From bits to waveforms

- Pulse shapes: NRZ, RZ and Manchester
- Mapping of bits to amplitudes: Polar, unipolar and AMI
- Power spectral densities

The presentation is in online (github or Canvas): [2_PulseShaping.pdf](#)
