

## Interleaving for slow flat fading channels

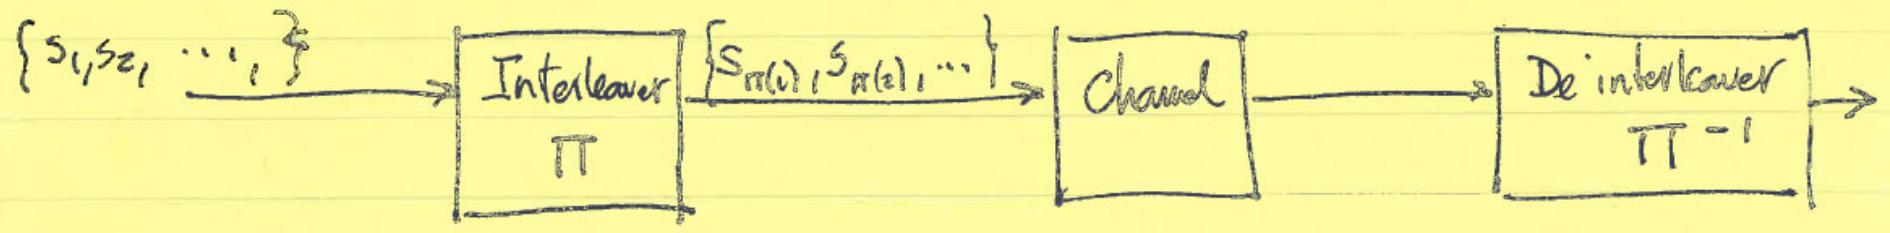

Goal: Make symbols (correlated) independent

$$\text{Coherence time : } T_c = \frac{1}{B_d} = \frac{1}{2f_m} = \frac{1}{2\frac{\sqrt{V}}{\sigma}} = \left[ \frac{2}{2\sqrt{V}} \right] \sim \frac{1}{\sqrt{V}}.$$

$\Rightarrow$  "Scramble" correlated symbols (over  $T_c$  seconds)  
so that the received sequence has statistically  
independent symbols.

Interleaver (block type. There are other types)

Example :

(M=3, J=2)

Depth 2

write in →

$s_1$	$s_2$	$s_3$
$s_4$	$s_5$	$s_6$

↓  
read out

Gives

$$\{s_{n(1)}, s_{n(2)}, \dots\} = \{s_1, s_4, s_2, s_5, s_3, s_6\}$$

2/3

De interleaver :

write in ↓

$s_1$	$s_4$
$s_2$	$s_5$
$s_3$	$s_6$

gives  $\{s_1, s_2, s_3, s_4, s_5, s_6\}$

read out

Interleaver (Indices shown)

M columns

J rows

	1	2	..	M
	M+1	M+2	..	2M
:	:	..	..	:
	(J-1)M+1	..	..	JM

write-in →

read-out ↓

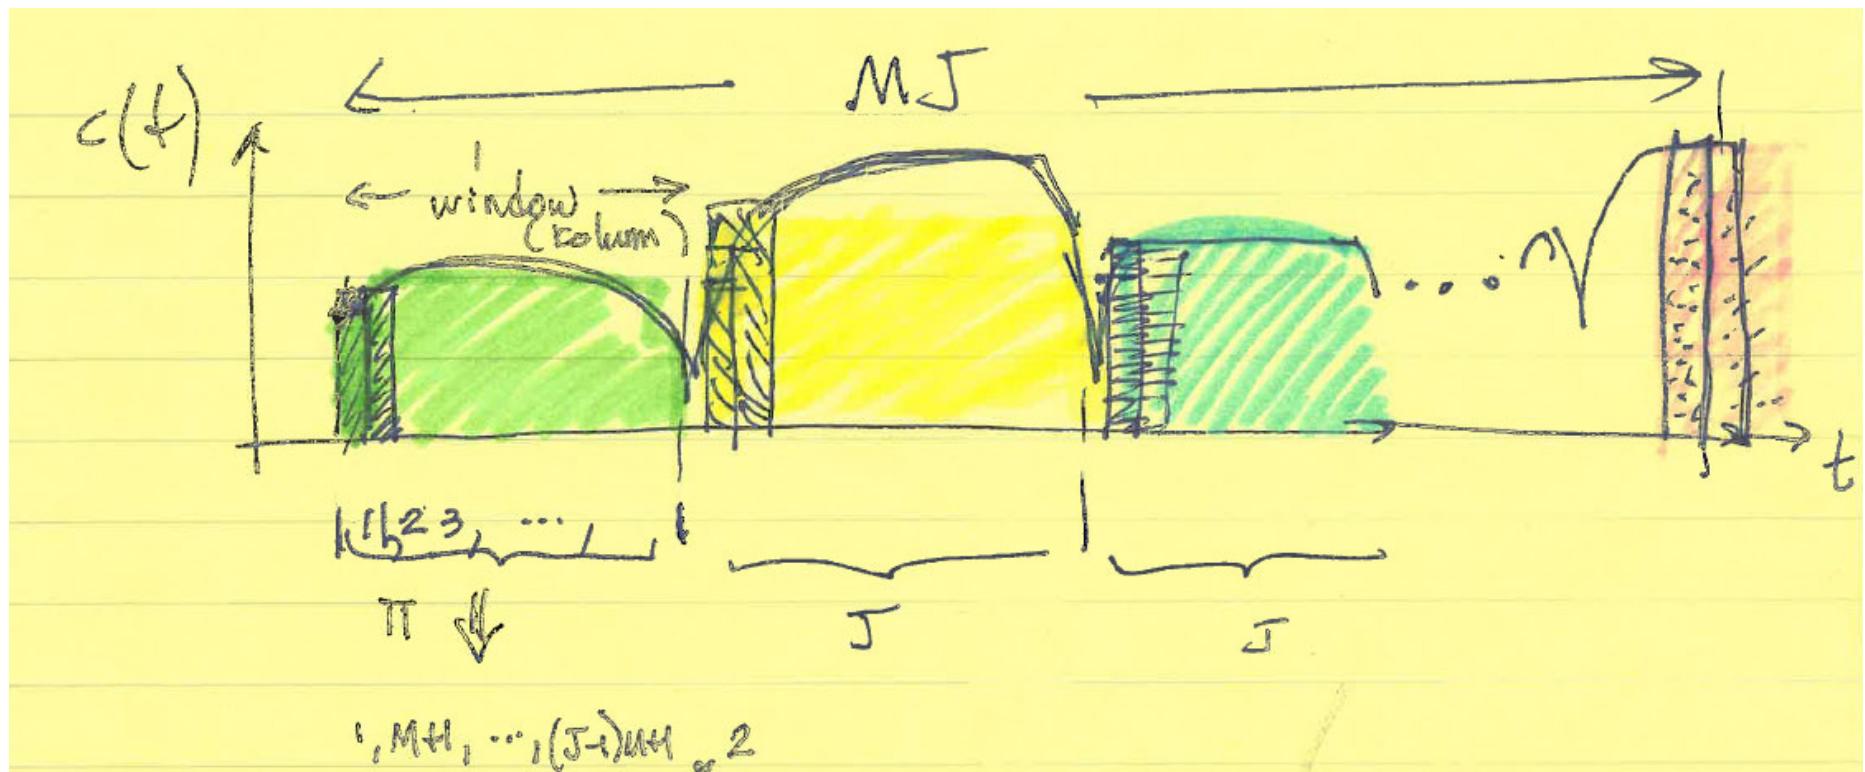

Deinterleaver :

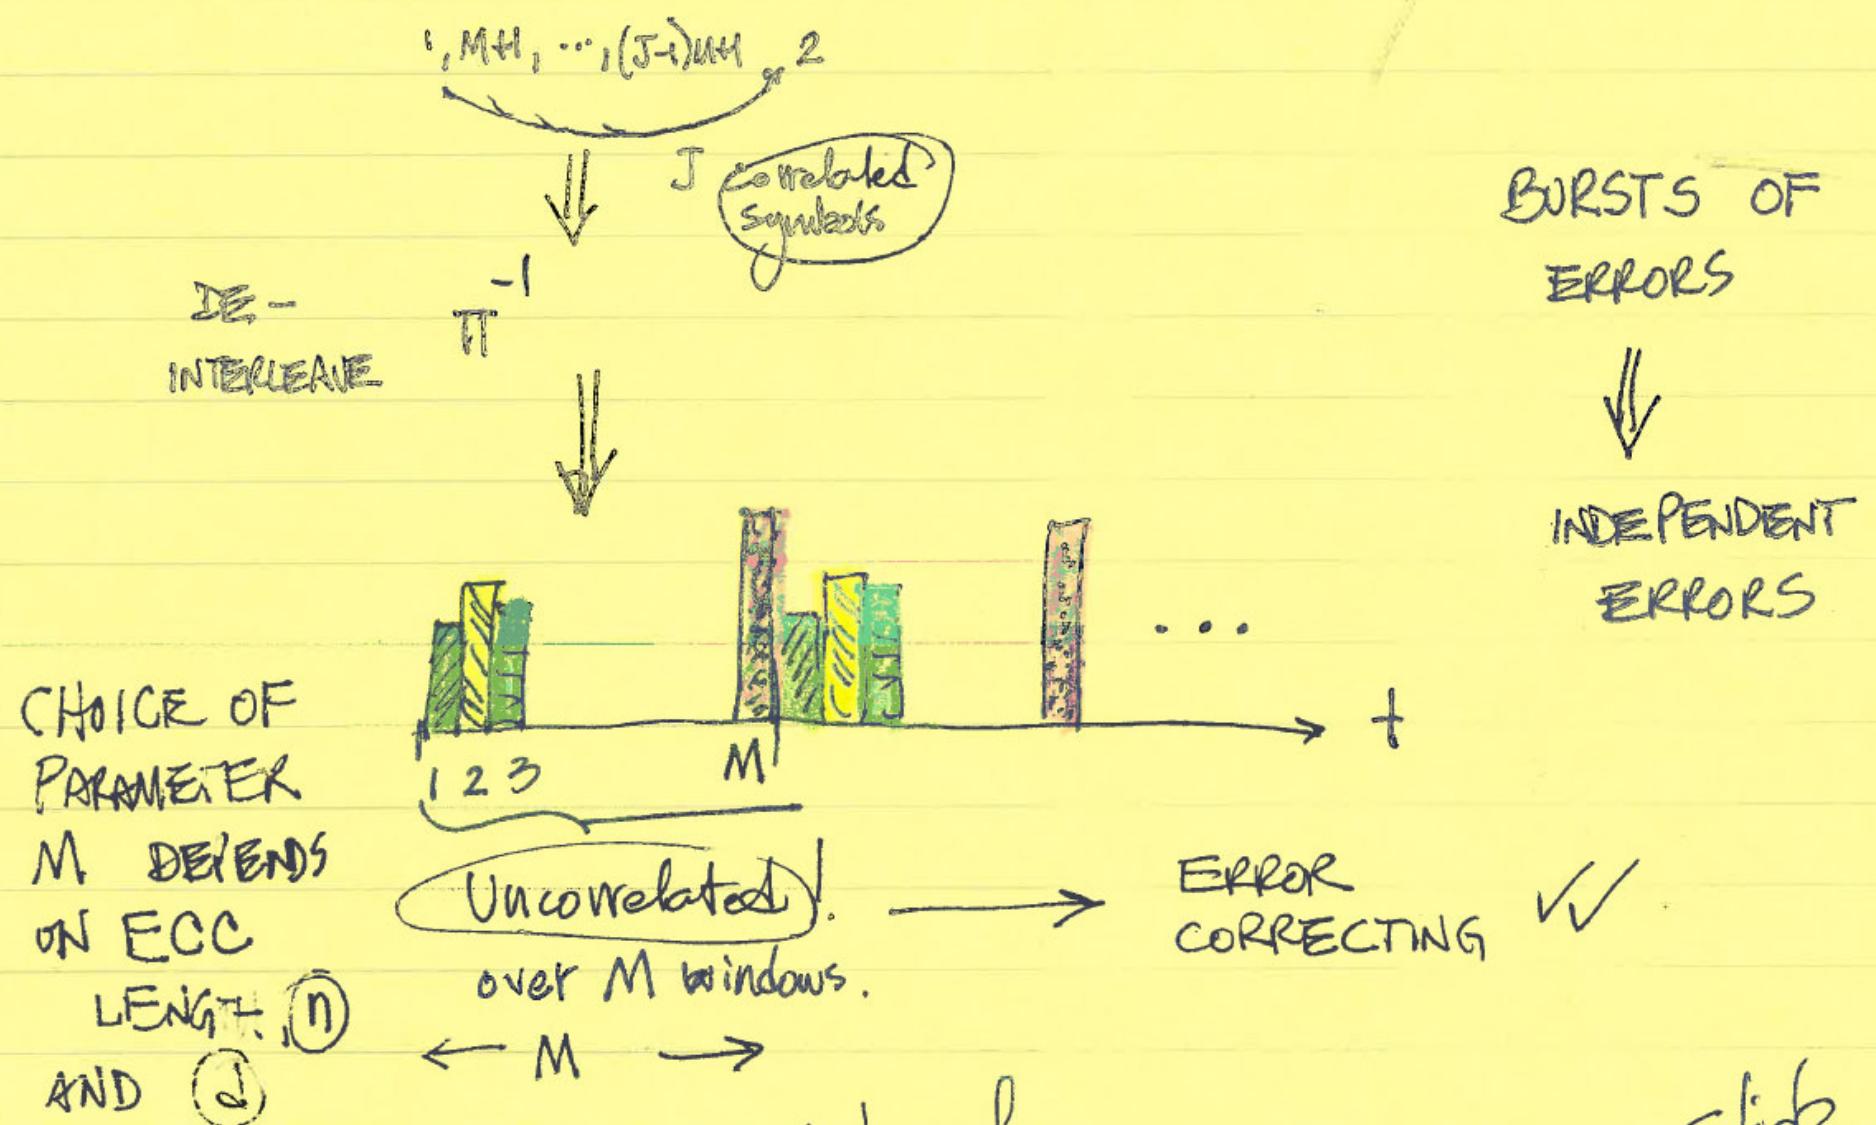

write-in

1	M+1		(J-1)M+1
2	M+2		
.	.		
M	2M		JM

read-out →

write-in

Works if

$$JT > T_c$$

$$J > \frac{\lambda}{2N} \frac{1}{T}$$

or

slide

$$J > \frac{\lambda}{2v} R$$
